

Atty. Docket No. 17312

Abstract

An engine hood includes an outer shell with vertical front, right and left sides and a planar top that covers an engine and its radiator. An inner panel is fixed to the inner surface of the hood underneath an opening in the top. This inner panel directs air passing through the opening in the top forward to in front of the radiator. The inner panel is fixed to the hood at its rear and side edges, and abuts the top of the radiator with its front edge. This prevents heated air flow from behind the radiator over the top of the radiator and into the radiator air inlet and the combustion air inlet.
